# **API INTEGRATION AND DATA MIGRATION**

#### **HACKATON-03 | DAY 3**

### 1. API integration process:-

First, I created a schema in Sanity CMS with fields like name, price, description, and image for products. Then, I made a migration script (import-data.mjs) to fetch data from the API and match it with the schema. After that, I followed the steps provided in Template 4's documentation, where I set up the .env file with the required details, like the Sanity project ID and API token. Finally, I ran the command "npm run import-data" (as mentioned in the documentation), which imported the data into Sanity CMS. Now, the data shows up in Sanity Studio, and my frontend displays it correctly.

#### 2. API integration process:-

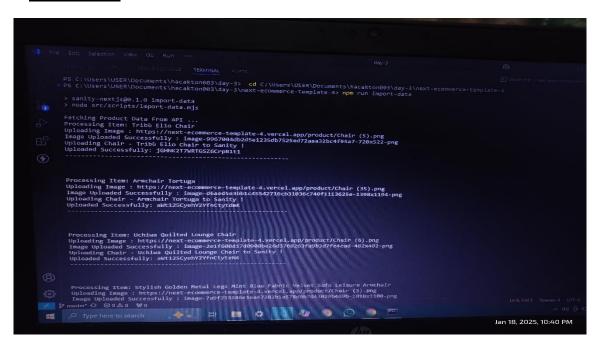

To align the Sanity CMS schema with the API data structure, I made adjustments and included the following fields:

- Image: To store the product image.
- <u>Title:</u> To store the product name or title.
- <u>Description</u>: To store the product details and description.
- <u>Price</u>: To store the product price.
- <u>Discount:</u> To track any discounts applied to the product.
- Category: To categorize the product (e.g., electronics, clothing, etc.).
- Stock: To manage the available stock or inventory of the product.

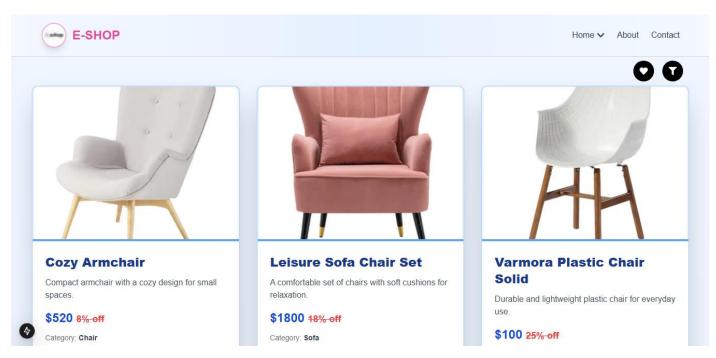

These fields were carefully mapped to ensure compatibility with the API data, allowing seamless data migration and integration into Sanity CMS.
